

# Short introduction about the German glow-worm survey

by René Spierling

*Lampyris noctiluca*;  
female  
picture by D. Weiß  
(<http://www2.uni-jena.de/chemie/institute/oc/weiss>)

*Lamprohiza splendula*;  
female  
picture by D. Weiß  
(<http://www2.uni-jena.de/chemie/institute/oc/weiss>)

# Contents:

- 1.0 Introduction
- 2.0 German Glow-worm Survey
- 3.0 Distribution of Lampyridae in Germany

## 1.1 Who did it?:

Biology student from Germany

Firefly related activities:

- Running a survey attempt for Germany
- Breeding *Lampyris sardiniae*

## 2.1 Where, since when and how?:

**www.lampyridae.de.vu**

Lampyridae; Deutschland; Verbreitungundersuchung

(<http://www.geocities.com/millenpopille/glow>)

Started in the year 2000

## 2.1 Where, since when and how?:

A survey form can be copied/downloaded from the website...

Some of the questions there are:

What species? (Did they glow during flight?)

What type of site and how is it managed?

Open water nearby?

Chemical treatment?

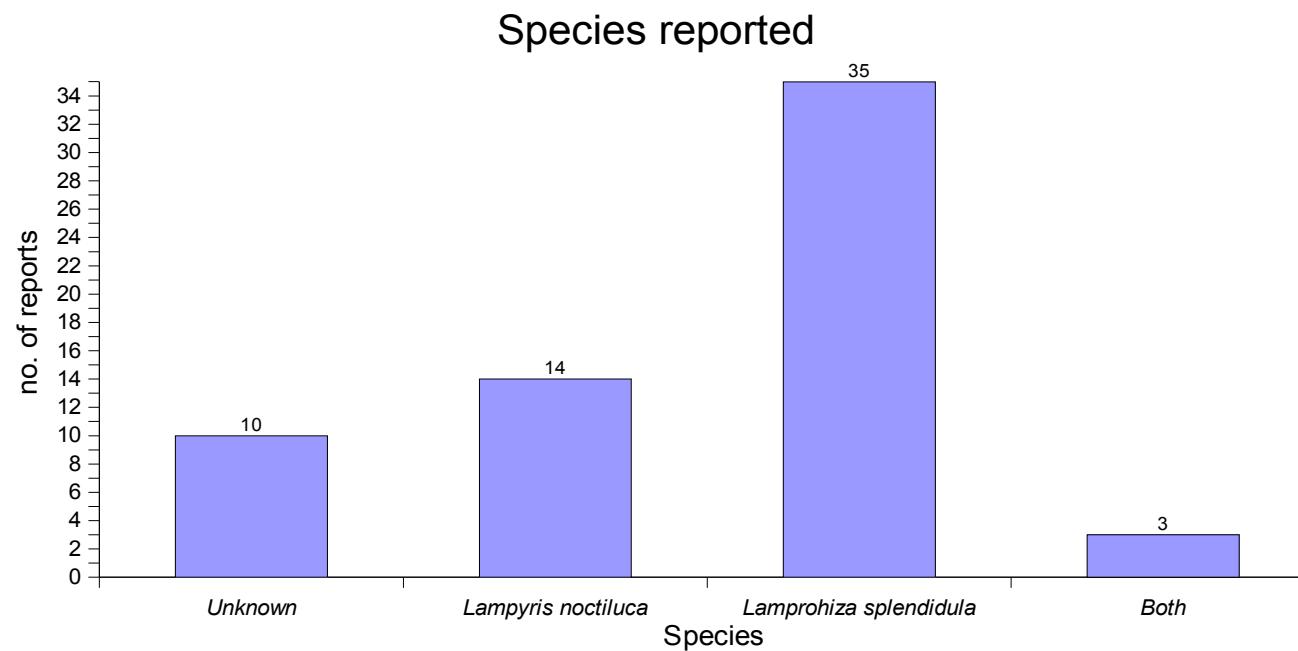

Artificial light at night nearby?

Where were the Fireflies?

## 2.2 Feedback:

Reported sites:

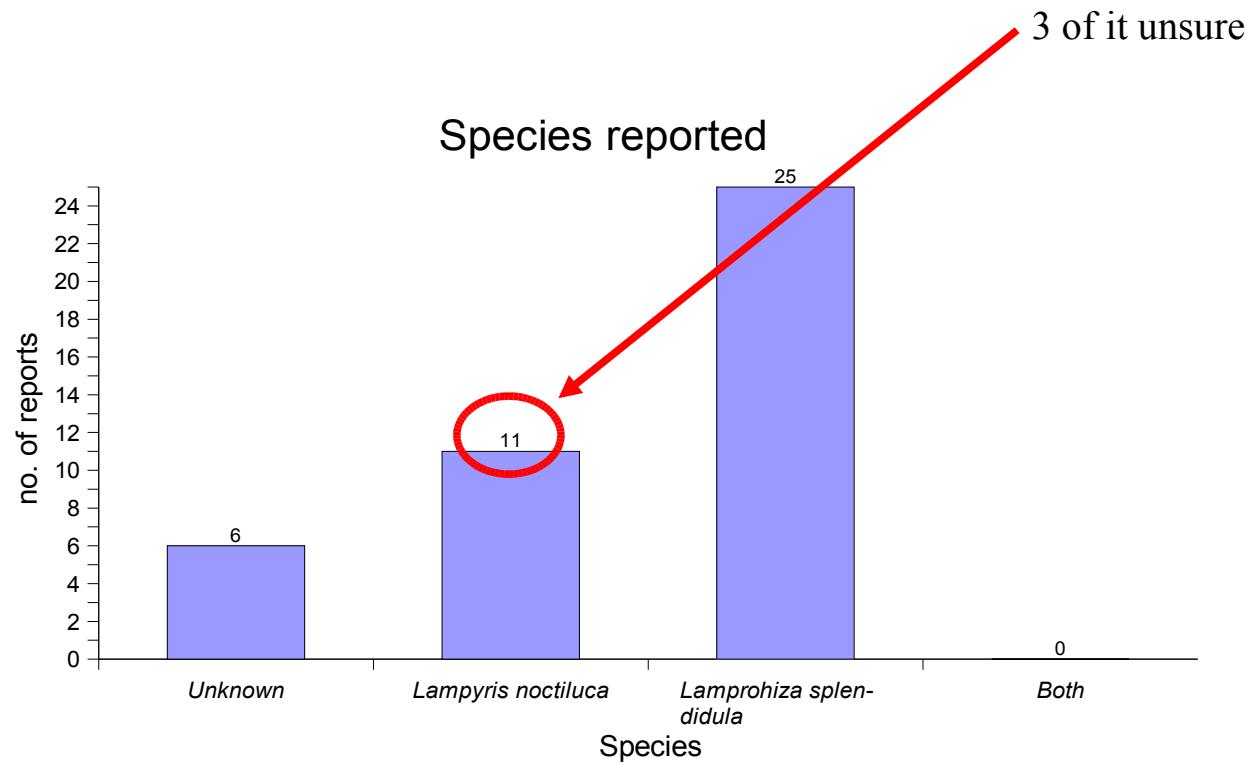

2000 - 2004: 62

## 2.2 Feedback:

Reported sites:

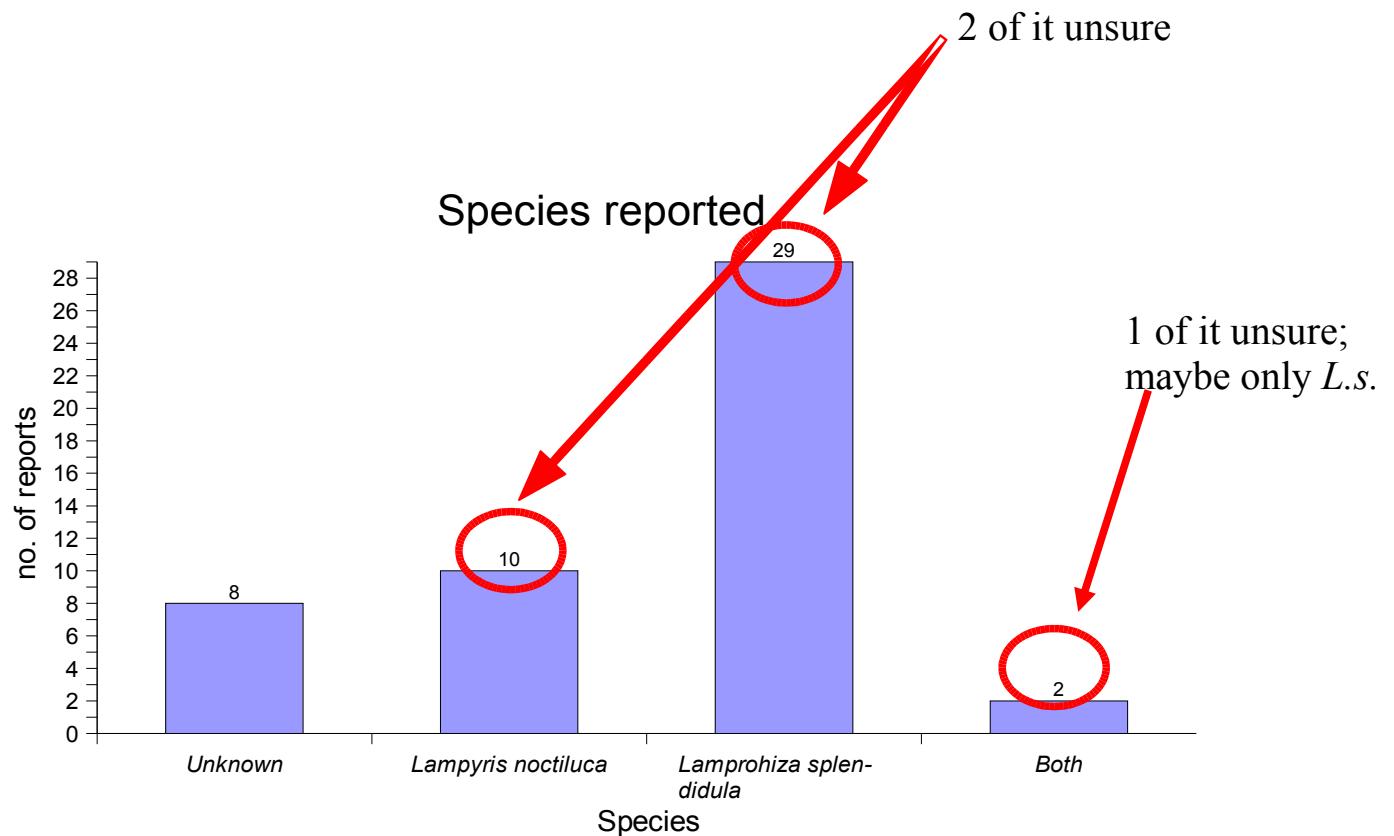

2005: 42

## 2.2 Feedback:

Reported sites:

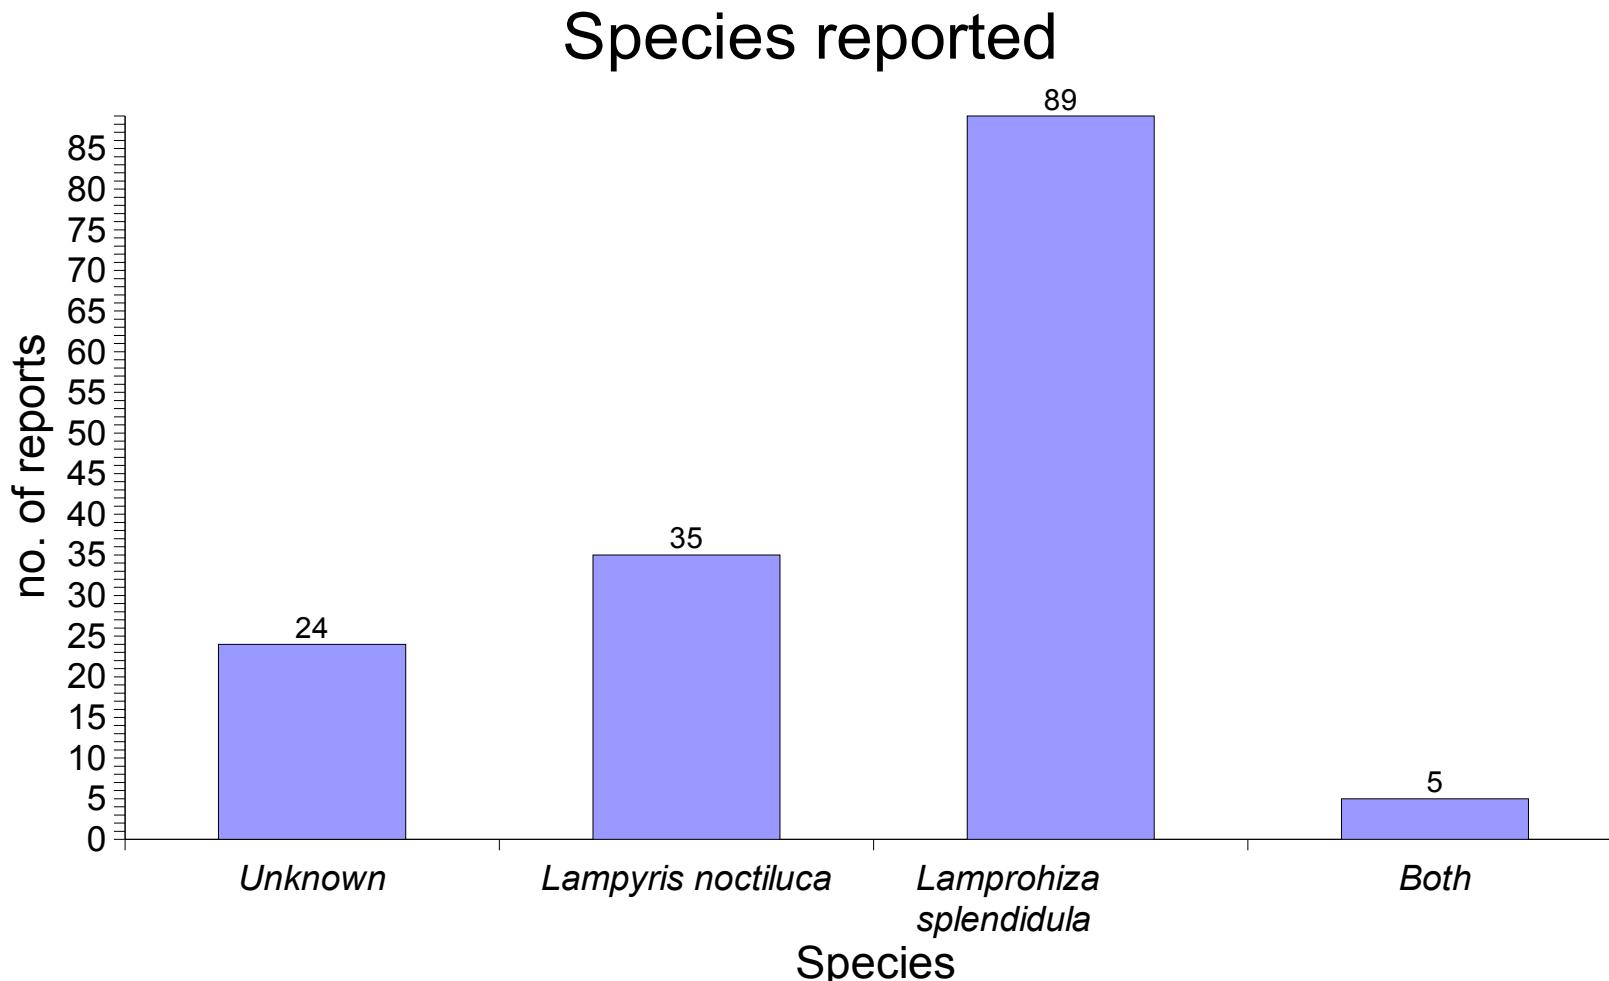

2006: 49

## 2.2 Feedback:

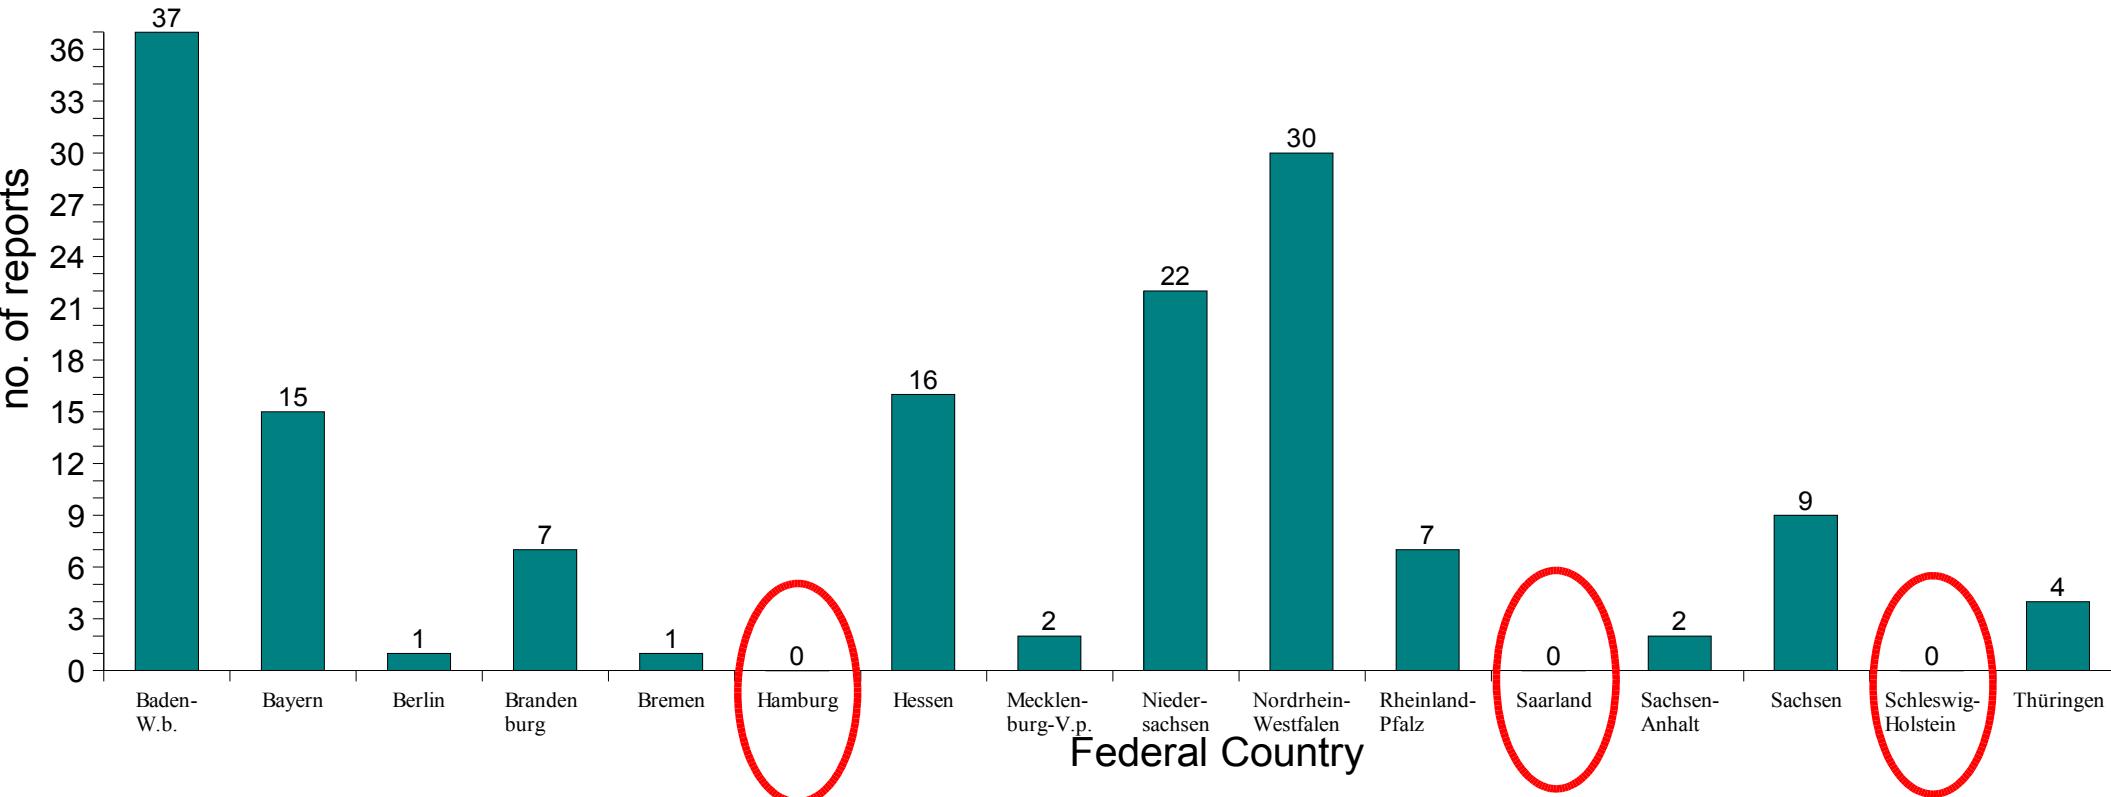

Reported sites:

Total (2000 - 2006): 153

## 2.2 Feedback:

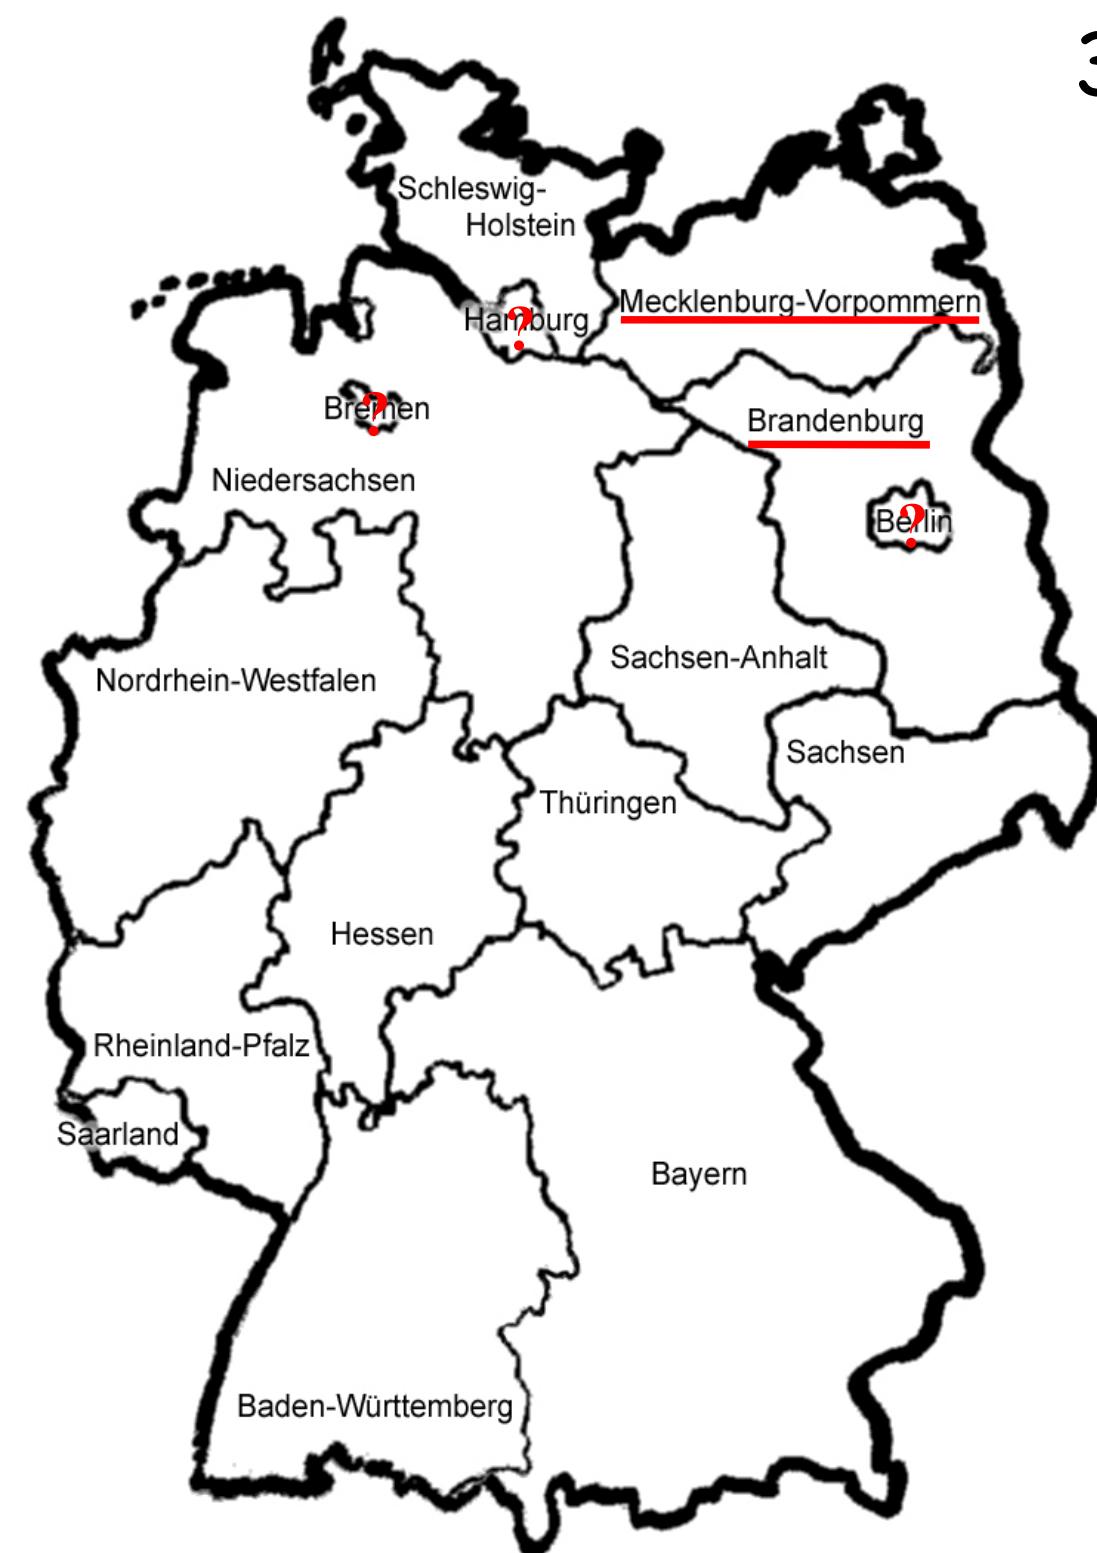

Federal Country of reports  
2000 - 2006

## 2.3 Problems:

- Reports very heterogeneous
  - Species determination problematic (e.g. *Lamprohiza splendidula* could hide sympatric *Lampyris noctiluca* if only “glowing in flight”-trait is used)
- Non-lampyrid fireflies/glow-worms?  
(e.g. *Microscolex phosphoreus* (Oligocheata);  
*Scolioplanes crassipes*, *Geophilus carpophagus* (Myriapoda),  
*Ceroplatus testaceus* (Diptera))
- Heavy bias in the collected data
- How to separate sites?
  - => Only qualitative (if any) conclusions possible

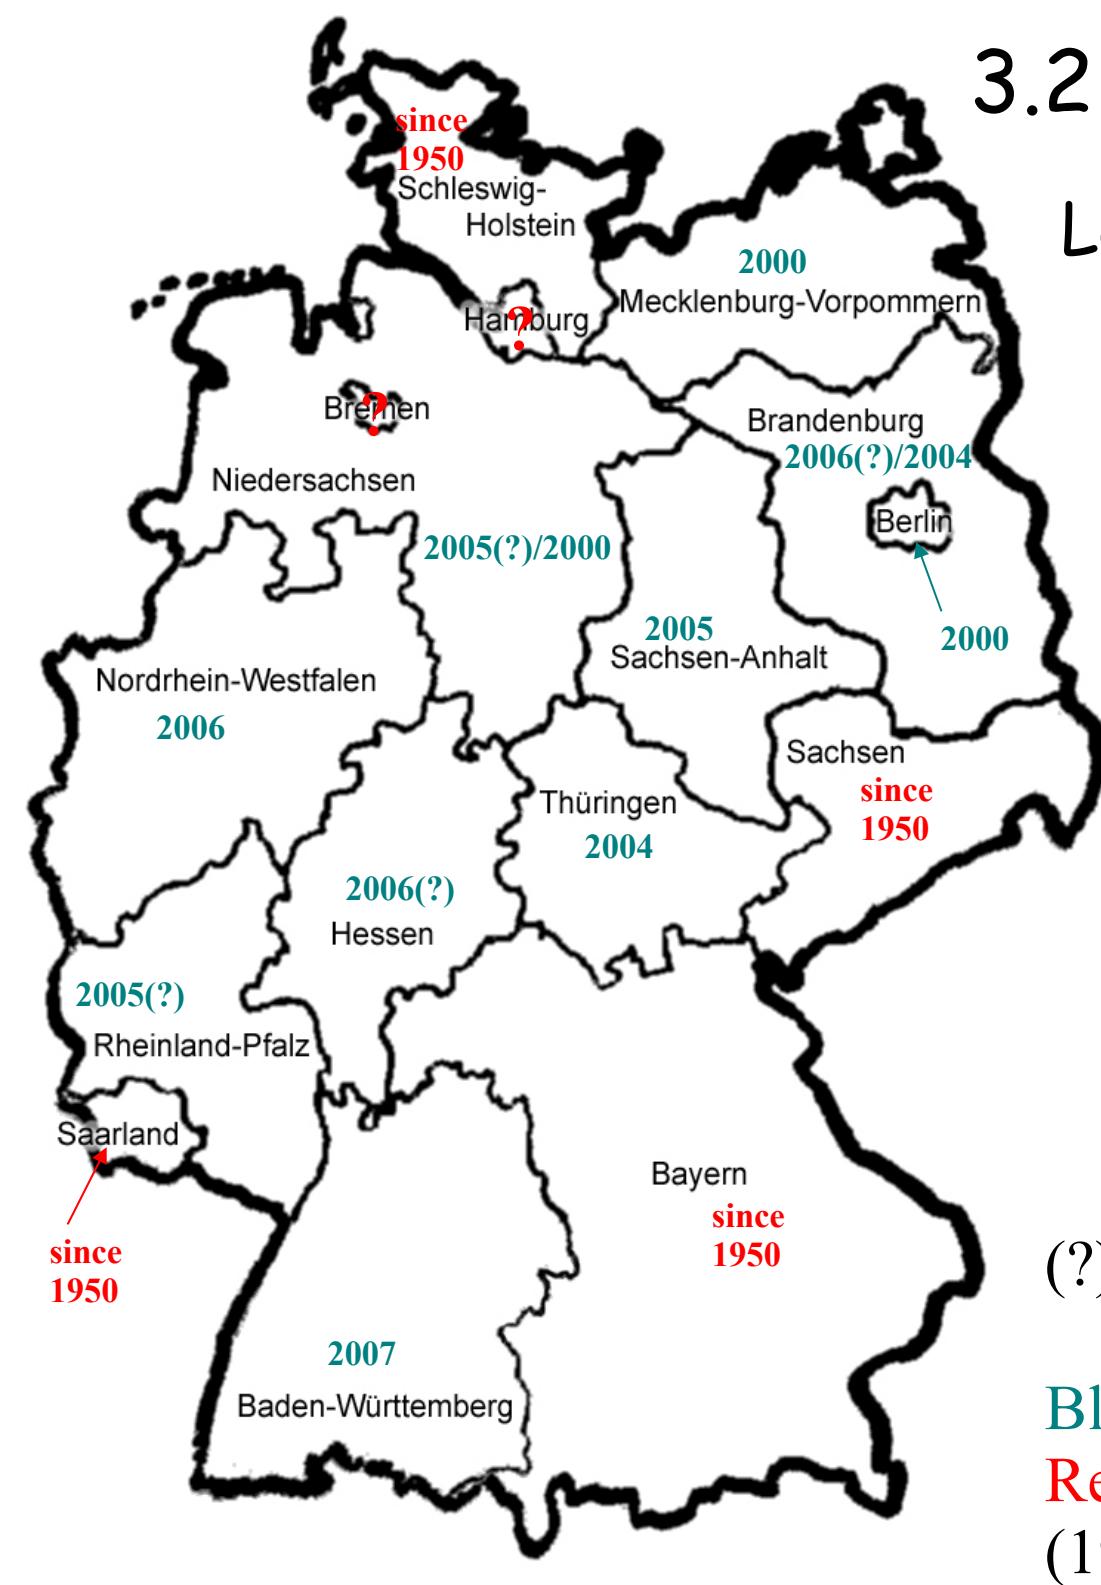

### 3.1 Distribution according to KÖHLER & AHRENS (1999):

All 3 species found in every\*  
federal country after 1950,  
except  
*Lamprohiza splendidula* in **Mecklenburg-**  
**Vorpommern** only before 1900  
and in **Brandenburg** only before 1950  
and *Phosphaenus hemipterus* also in  
**Brandenburg** only before 1950

\* not explicitly stated for the city states

## 3.2 A more recent Distribution of *Lampyris noctiluca* (L., 1758):

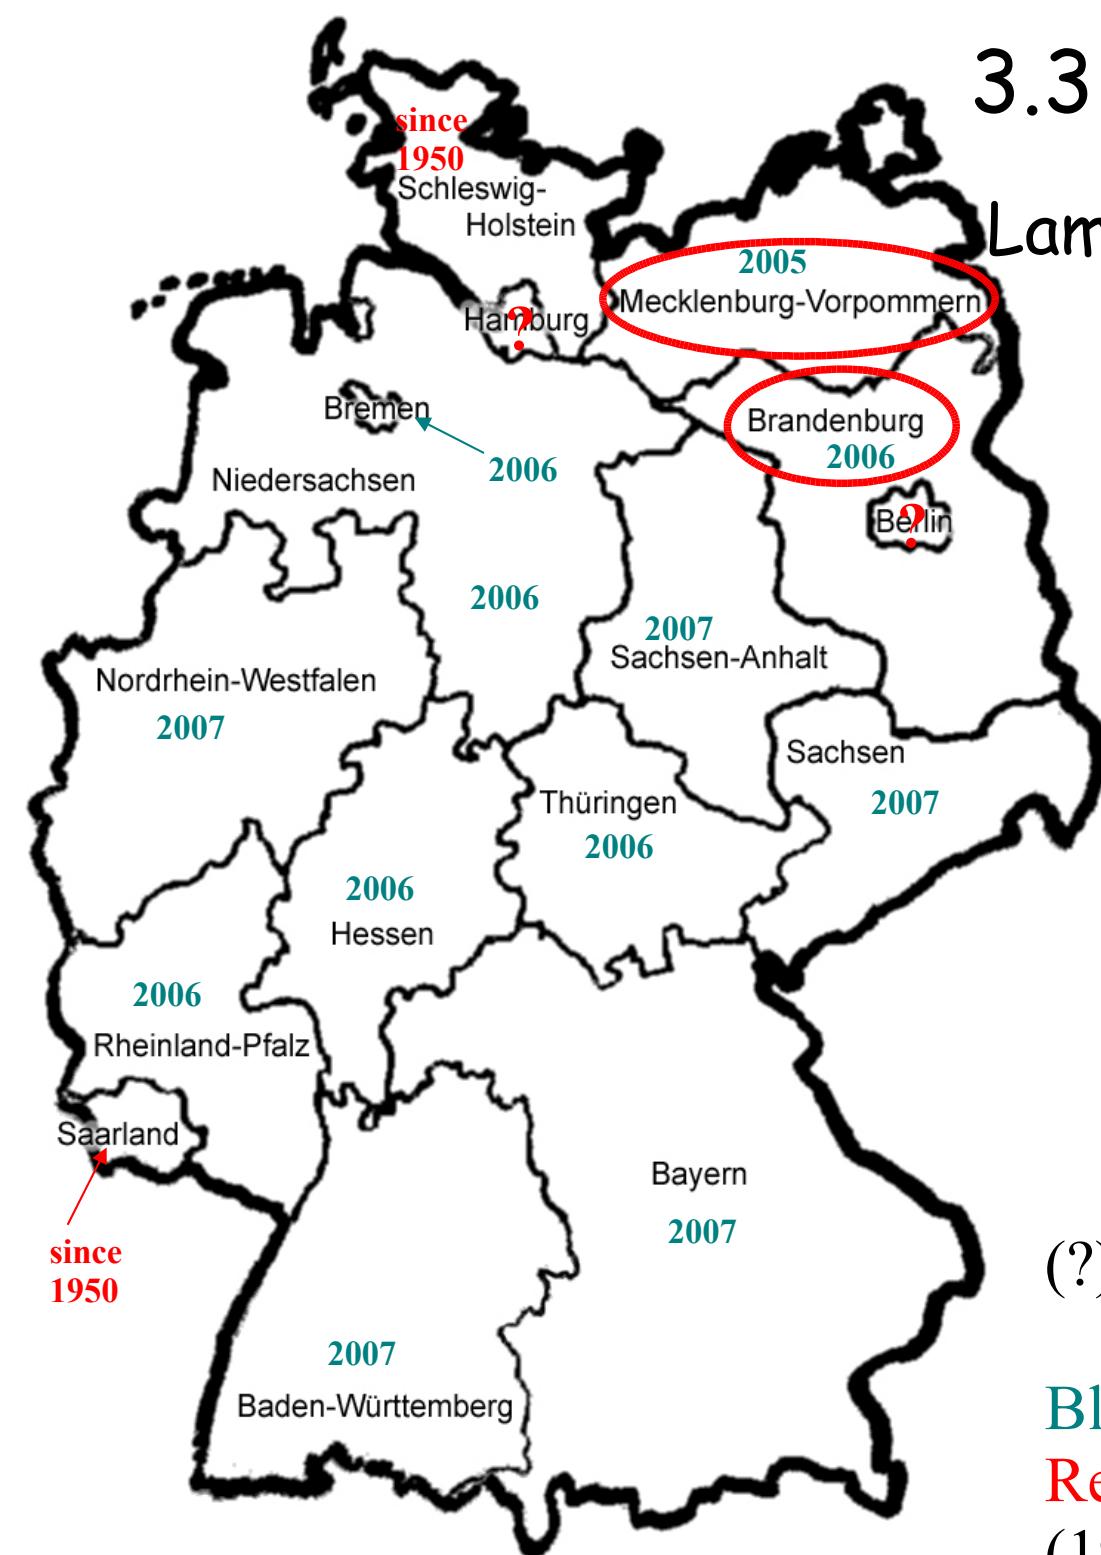

(?) = Unsure species determination

Bluegreen = Most recent data from GGS

Red = Data from KÖHLER & AHRENS (1999)

### 3.3 A more recent Distribution of *Lamprohiza splendidula* (L., 1767):

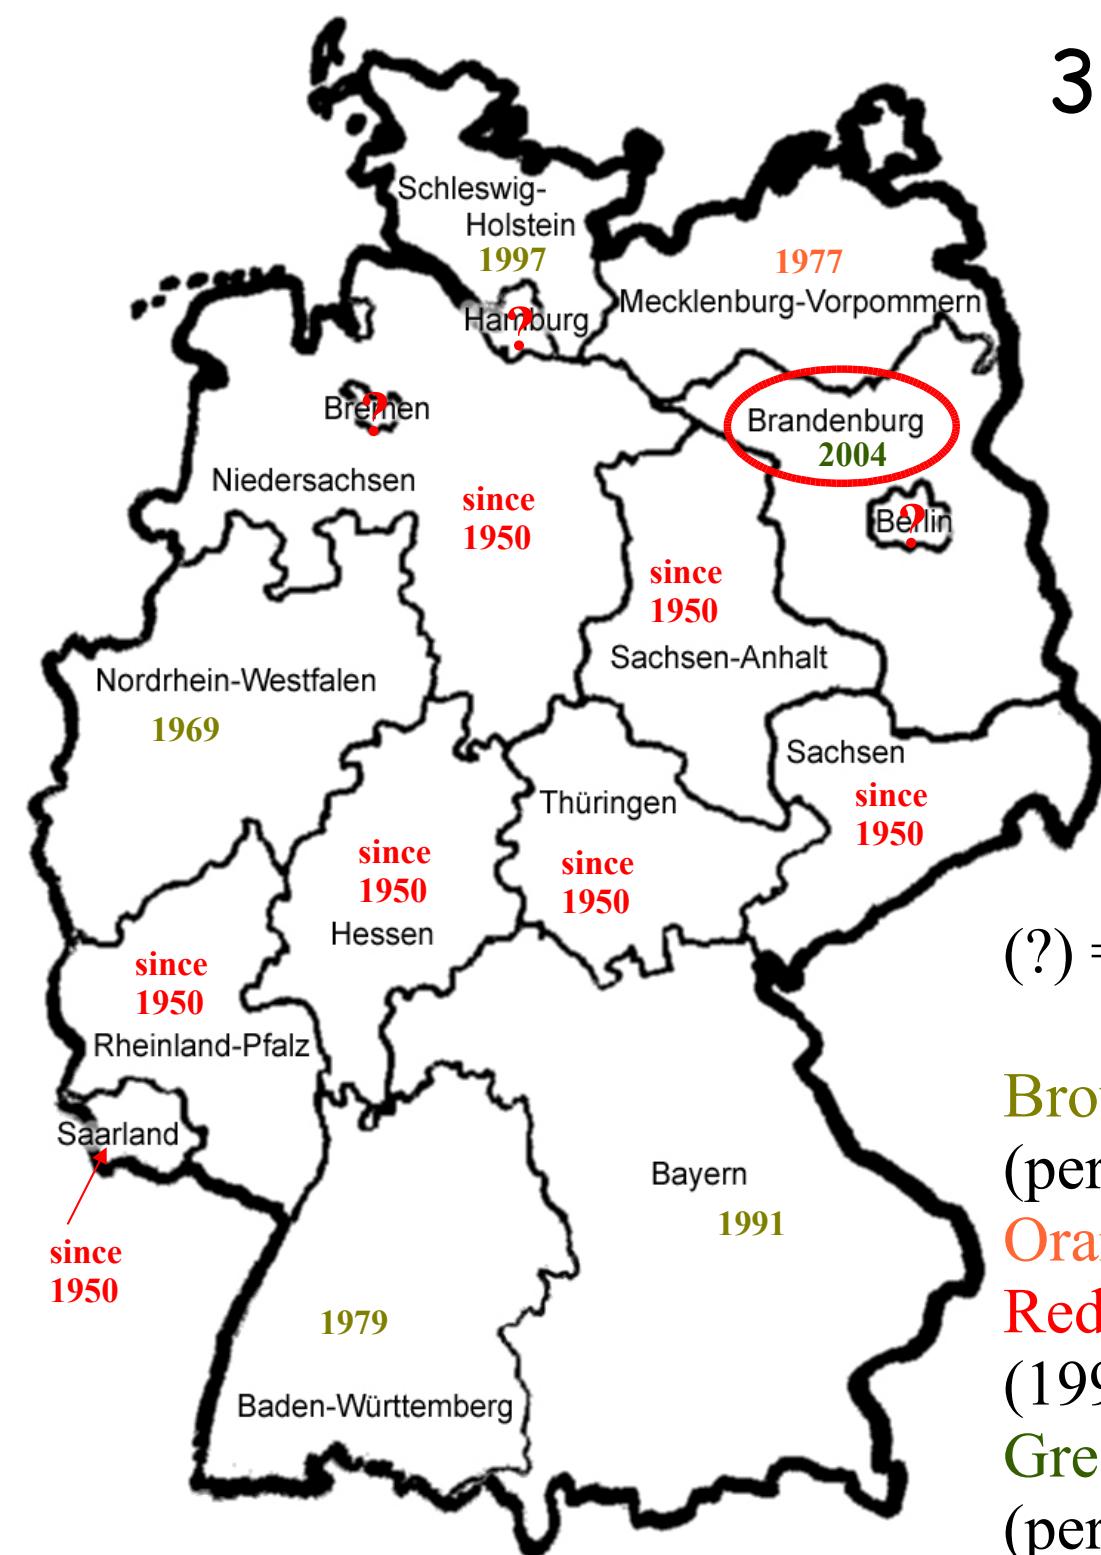

(?) = Unsure species determination

Bluegreen = Most recent data from GGS

Red = Data from KÖHLER & AHRENS (1999)

### 3.4 A more recent Distribution of *Phosphaenus hemipterus* (Goeze, 1777):

Listed as  
category 3 “endangered“  
in the  
“Rote Liste der Tiere Deutschlands“

(?) = Unsure species determination

**Brown** = Most recent data from TOLASCH  
(pers. com.)

**Orange** = Data from MEßNER (1979)

**Red** = Data from KÖHLER & AHRENS  
(1999)

**Green** = Most recent data from KÖHLER  
(pers. com.)

# Conclusion:

“Success”: *Lamprohiza splendidula* “rediscovered” in Mecklenburg-Vorpommern and Brandenburg...

What else was it good for? -> A potential help for choosing sites for further studies (e.g. “real” surveys)...

To do list: A deeper look at the literature, “Advertisement“ (then maybe a more organized and quantitative approach is possible), ...
